Atmospheric pressure as an Ecological Factor

Background Information

Atmospheric pressure, also called barometric pressure, force per unit area exerted by an atmospheric column. Atmospheric pressure can be measured with a mercury barometer. As elevation increases, there is less overlying atmospheric mass, so that atmospheric pressure decreases with increasing elevation. Pressure measures force per unit area, with SI units of **Pascal's**. On average, a column of air with a cross-sectional area of 1 square centimeter (cm²), measured from sea level to the top of Earth's atmosphere, has a mass of about **1.03 kilogram** and exerts a force or "weight" of about **10.1 newton's**.

surface air pressure = weight of air in column above unit area

BIOLOGY \ ECOLOGY lab

An **atmosphere (atm)** is a unit of measurement equal to the average air pressure at sea level at a temperature of 15 degrees Celsius (59 degrees Fahrenheit). One atmosphere is **1,013 millibars, or 760 millimeters** (29.92 inches) of mercury.

As the pressure decreases, the **amount of oxygen** available to breathe also decreases. At very high altitudes, atmospheric pressure and available oxygen get so low that people can become sick and even die.

Atmospheric pressure is an **indicator** of weather. When a low-pressure system moves into an area, it usually leads to cloudiness, wind, and precipitation. High-pressure systems usually lead to fair, calm weather.

Atmospheric pressure measurement method & devices

- 1. Water-based barometers
- 2. Mercury barometers
- 3. Aneroid barometers
- 4. Barographs

	Specific weight of Hg = 13,6 Specific weight of water = 1
760 mmHg	Pressure of 1 Atm as a column of water: 13,6 x 0,760 m = 10,336 m

Wind as an Ecological Factor

Background Information

Wind is the flow of gases on a large scale. On the surface of the Earth, wind consists of the bulk movement of air. In **meteorology**, winds are often referred to according to their **strength**, and the **direction** from which the wind is blowing. winds have various names associated with their average strength, such as **breeze**, **gale**, **storm**, and **hurricane**.

Wind is caused by **differences** in the **atmospheric pressure**. When a difference in atmospheric pressure exists, air moves from the **higher** to the **lower** pressure area, resulting in winds of various speeds. **Wind direction** is usually expressed in terms of the direction from which it originates. **For example**, a northerly wind blows from the north to the south.

Role of wind in the natural world and environment

- 1- Erosion
- 2- Desert dust migration
- 3- Effect on plants
- 4- Effect on animals
- 5- Sound generation

Wind speed measuring devises

• Anemometer

An anemometer is a device used for measuring wind speed. The term is derived from the Greek word **anemos**, which means wind, and is used to describe any wind speed instrument used in **meteorology**

- 1- Vane style anemometer
- 2- Helicoid propeller anemometer
- 3- Hand held anemometer
- 4- Digital anemometer

Turbidity as an Ecological Factor

Background Information

Turbidity is the **cloudiness** or **haziness** of a fluid caused by large numbers of **individual particles** that are generally **invisible** to the naked eye, similar to smoke in air. The measurement of turbidity is a key test of **water quality**.

Fluids can contain suspended solid matter consisting of particles of many different sizes. While some **suspended material** will be **large** enough and heavy enough to **settle rapidly** to the bottom of the container if a liquid sample is left to stand (the **settable solids**), **very small particles** will settle only very slowly or not at all if the sample is regularly agitated or the particles are **colloidal**. These small solid particles cause the liquid to appear turbid.

BIOLOGY \ ECOLOGY lab	LAB	3

Turbidity in open water may be caused by growth of **phytoplankton**. Human activities that disturb land, such as **construction**, **mining** and **agriculture**, can lead to high sediment levels entering water bodies during rain storms due to storm water runoff. In **drinking water**, the higher the turbidity level, the higher the risk that people may develop **gastrointestinal diseases**.

Turbidity Measurement

Turbidity measured with an instrument called a **nephelometer**, the units of turbidity from a calibrated **nephelometer** are called **Nephelometric Turbidity Units** (NTU).

Turbidity in **lakes**, reservoirs, channels, and the ocean can be measured using a **Secchi disk**.

The **World Health Organization**, establishes that the turbidity of drinking water should not be more than **5 NTU**, and should **ideally** be below **1 NTU**.
